
AI-native staffing, training or project teams.

For when you need
extra capacity, want
to train your teams or
need software delivered.

The AI ambition is there. The bottleneck is adoption.

AI has to land in existing teams

The challenge is not just tooling. It is about developers who take AI into the whole process: from idea and analysis to code, tests, review, release and aftercare.

Everyone claims AI expertise

Few are truly AI-native. A strong CV says little about how someone handles agents, LLM errors and production risk. We assess real AI-native skill and focus on T-shaped profiles: deep in their craft, broad across the whole stack.

A bank demands a higher standard

For a bank-insurer, every step counts on security, governance and compliance. AI should be no exception.

Our credibility comes from building it ourselves.

For SMEs we deliver AI solutions in sales, finance, operations, support and administration, with training and aftercare as their long-term AI partner. SmartSpace, our own platform, brings together agents, knowledge, workflows and control, which forces us to think beyond demos. We assess people on code, architecture, evaluation, integrations and behaviour in production.

Three concrete tracks, one hands-on AI partner.

per developer

Staffing

One or more developers work inside KBC teams and bring AI-native delivery practice with them.

per team

Training

Teams are trained, or our developers are trained to act as the AI lead within the team.

per project

Dedicated project teams

A compact team delivers software, integrations or workflows with an AI-native way of working.

The tracks differ in form, not in standard: AI-native development that works in a real delivery context.

Why this is more than traditional staffing.

Practitioner standard

We assess candidates and teams from our own AI projects, not by keyword matching.

Several ways to engage

An individual developer, team training or a project team: a different form, the same quality standards.

Transferability

What we build or teach has to stay understandable for the KBC teams who carry it forward.

Honest advice

We do not place people for the sake of placing them.
If a candidate or an approach is not a match, we say so.

A partner of KBC for 20 years.

Through JArchitects, now We+, we spent two decades building a long-standing partnership with KBC. We bring that proven experience and that relationship to SmartAgents.

Developers who fit straight into KBC teams.

Delivery-ready

Developers who use AI in their engineering practice every day: agentic coding tools, MCP servers, skills and subagents, not as an experiment but as a way of working.

SmartAgents-certified

Screened by practitioners who build themselves, with internal AI-native training and technical backing from SmartAgents.

In your context

The developer works within your teams, ceremonies and tooling, inside your security, governance and compliance frameworks.

Staffing here is not a stream of CVs, but targeted reinforcement of existing delivery teams.

From role request to reinforcement in five steps.

01

Intake and profile

Sharpen the role, the stack and the team context: who are you really looking for?

02

Selection

A targeted search of our network of pre-qualified AI-native developers.

03

Technical screening

Code, architecture and AI thinking, assessed by practitioners.

04

KBC validation

You validate team fit, working style and practical readiness.

05

Start and follow-up

The developer starts at KBC, and SmartAgents stays involved on the substance.

T-shaped all-rounders, not narrow profiles.

Broad

Broad enough to think along across the whole stack. AI-native development makes that bar wider still.

Architecture and design

Infrastructure, network and cloud

Security and compliance

Delivery and quality

Deep

Deep core specialisation in their own craft.

Full-stack

Backend

Frontend

Data and ML

Platform and DevOps

Training that gets teams working AI-native.

Existing dev teams are trained on their own stack and tooling, not given generic AI awareness.

Setting up the dev environment

Code assistants, MCP and context on your own stack.

AI-native development

For analysis, code, tests and review, inside the daily work itself.

Agentic workflows

Recognising where they fit, and applying them yourself.

Working across teams

Shared prompts, conventions and guardrails across teams.

Our seconded developers take the same training beforehand and lead it inside the client team.

Delivering software the AI-native way.

The solution itself does not have to be about AI. The team delivers ordinary software, but uses AI in analysis, build, test and review.

build

Applications and features

New functionality in existing or new applications, built within the agreed architecture.

connect

Integrations and workflows

Links between systems, process steps and internal tooling, with clear owners and boundaries.

clean up

Modernisation

Refactoring, migrations, quality improvements and automation of repetitive development work.

wrap up

Delivery and handover

Repos, CI/CD, security rules, documentation and the runbook are part of the delivery.

One team, one scope, one delivery: not a standalone proof of concept, but working software with acceptance criteria.

AI capacity has to work within KBC's frameworks.

Data within your perimeter

Private or EU-hosted models, no training on your code or customer data, and clear data residency agreements.

Regulation-aware

A way of working aligned with the framework KBC operates in: DORA, GDPR, NIS2 and the EU AI Act, applied pragmatically.

Human-in-the-loop

Agents propose, people decide. Critical actions always need explicit approval and clear boundaries.

Kept under control, not left to sprawl.

every action

Auditable and traceable

Logging of prompts, actions and sources. Full reviewability for audit, risk and compliance.

every pipeline

Secure SDLC

RBAC, secret scanning, SAST/DAST and sandboxing built into the pipeline. AI speeds things up, security stays.

every model and every tool

Model and tool governance

Approved models and tools, version control, evaluation and monitoring.

What this delivers for your organisation.

More targeted

Every request gets the format that fits it:
capacity, team adoption or end-to-end delivery.

Stronger

More AI-native behaviour in existing teams: better screening,
better practices and less dependence on standalone tools.

Controlled

AI capacity within your frameworks: measurable,
auditable and aligned with your risk appetite.

Every engagement is different: we tailor the lead time and the approach to your roles, stack, teams and compliance requirements.

Technical depth, a pragmatic approach.

SmartAgents was founded in 2026. We build AI agents and automations ourselves, so we know exactly which AI-native developers KBC needs, and how to recognise them, deploy them and help them grow.

Founder
