SmartAgents

Recap and update

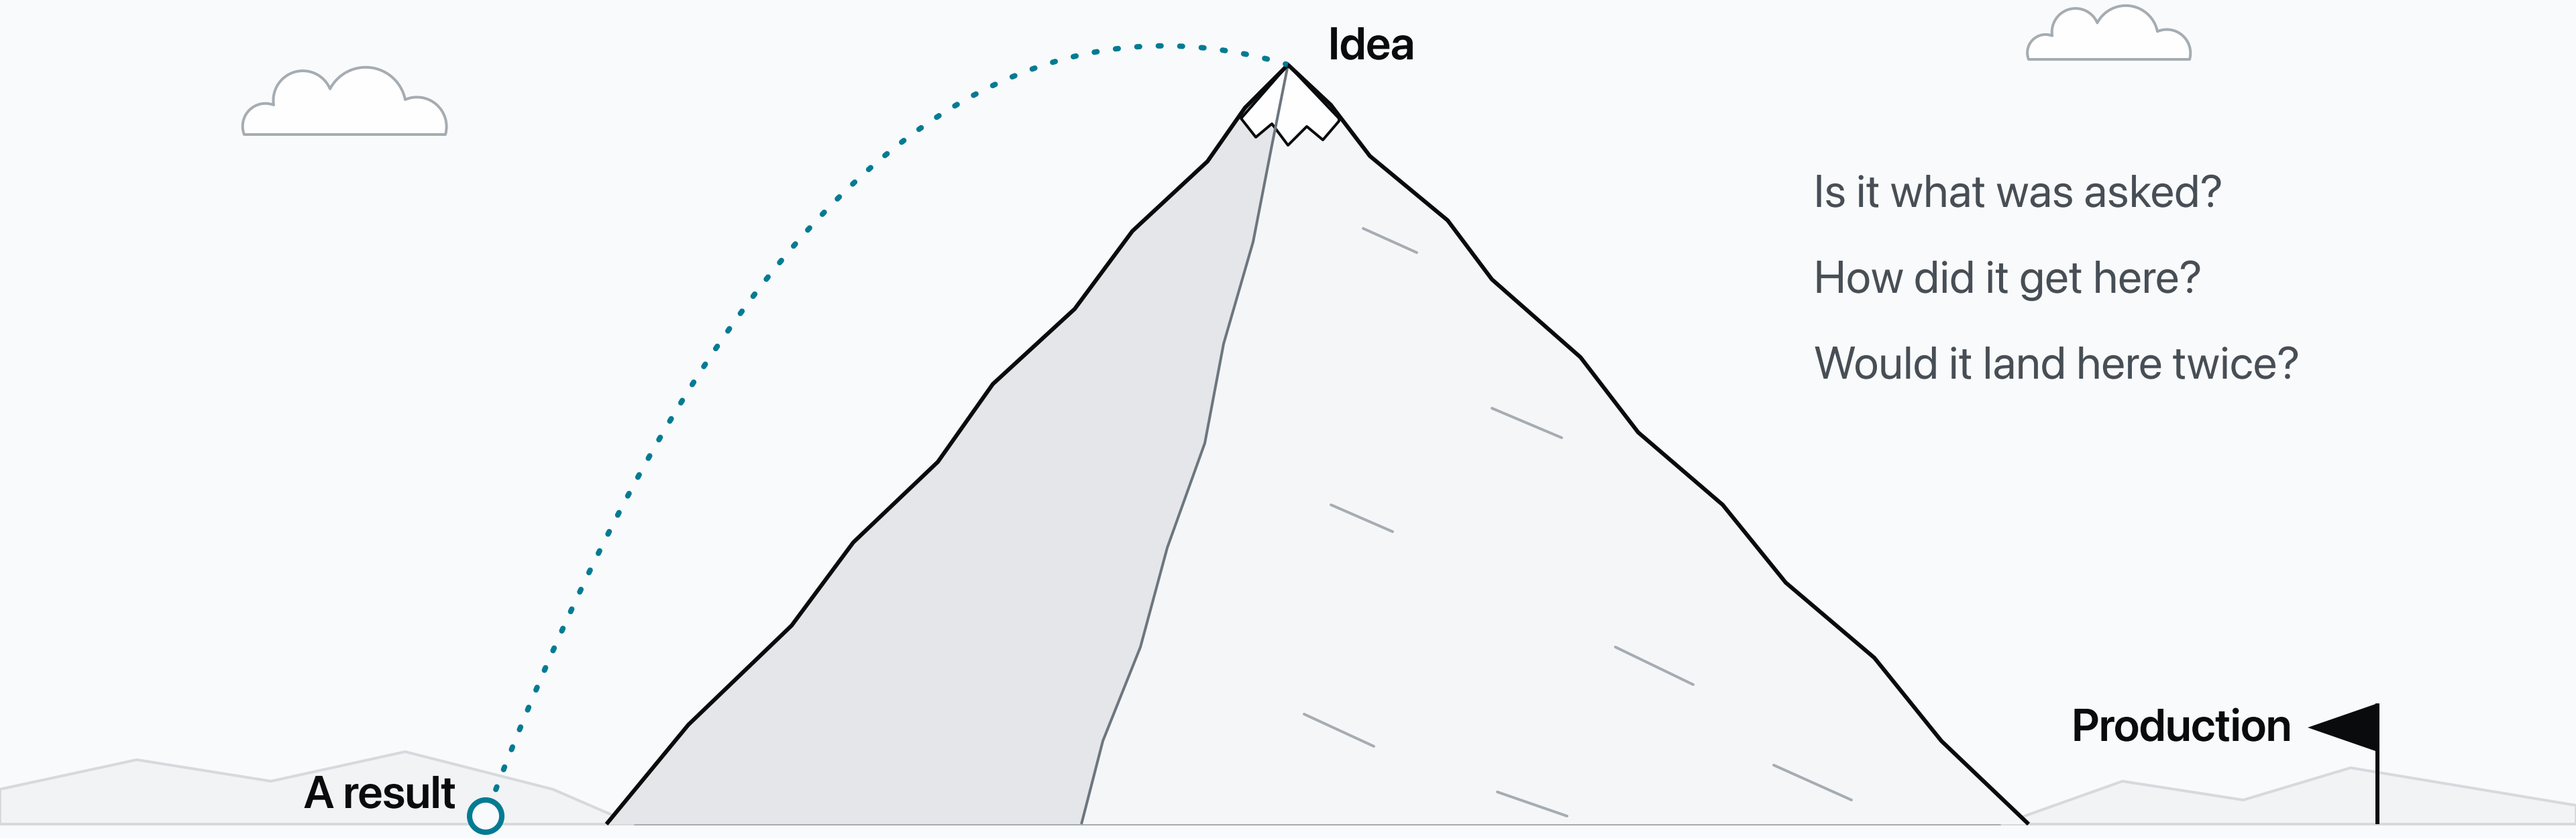

SmartAgents · Isabel · 27 October 2026

Recap

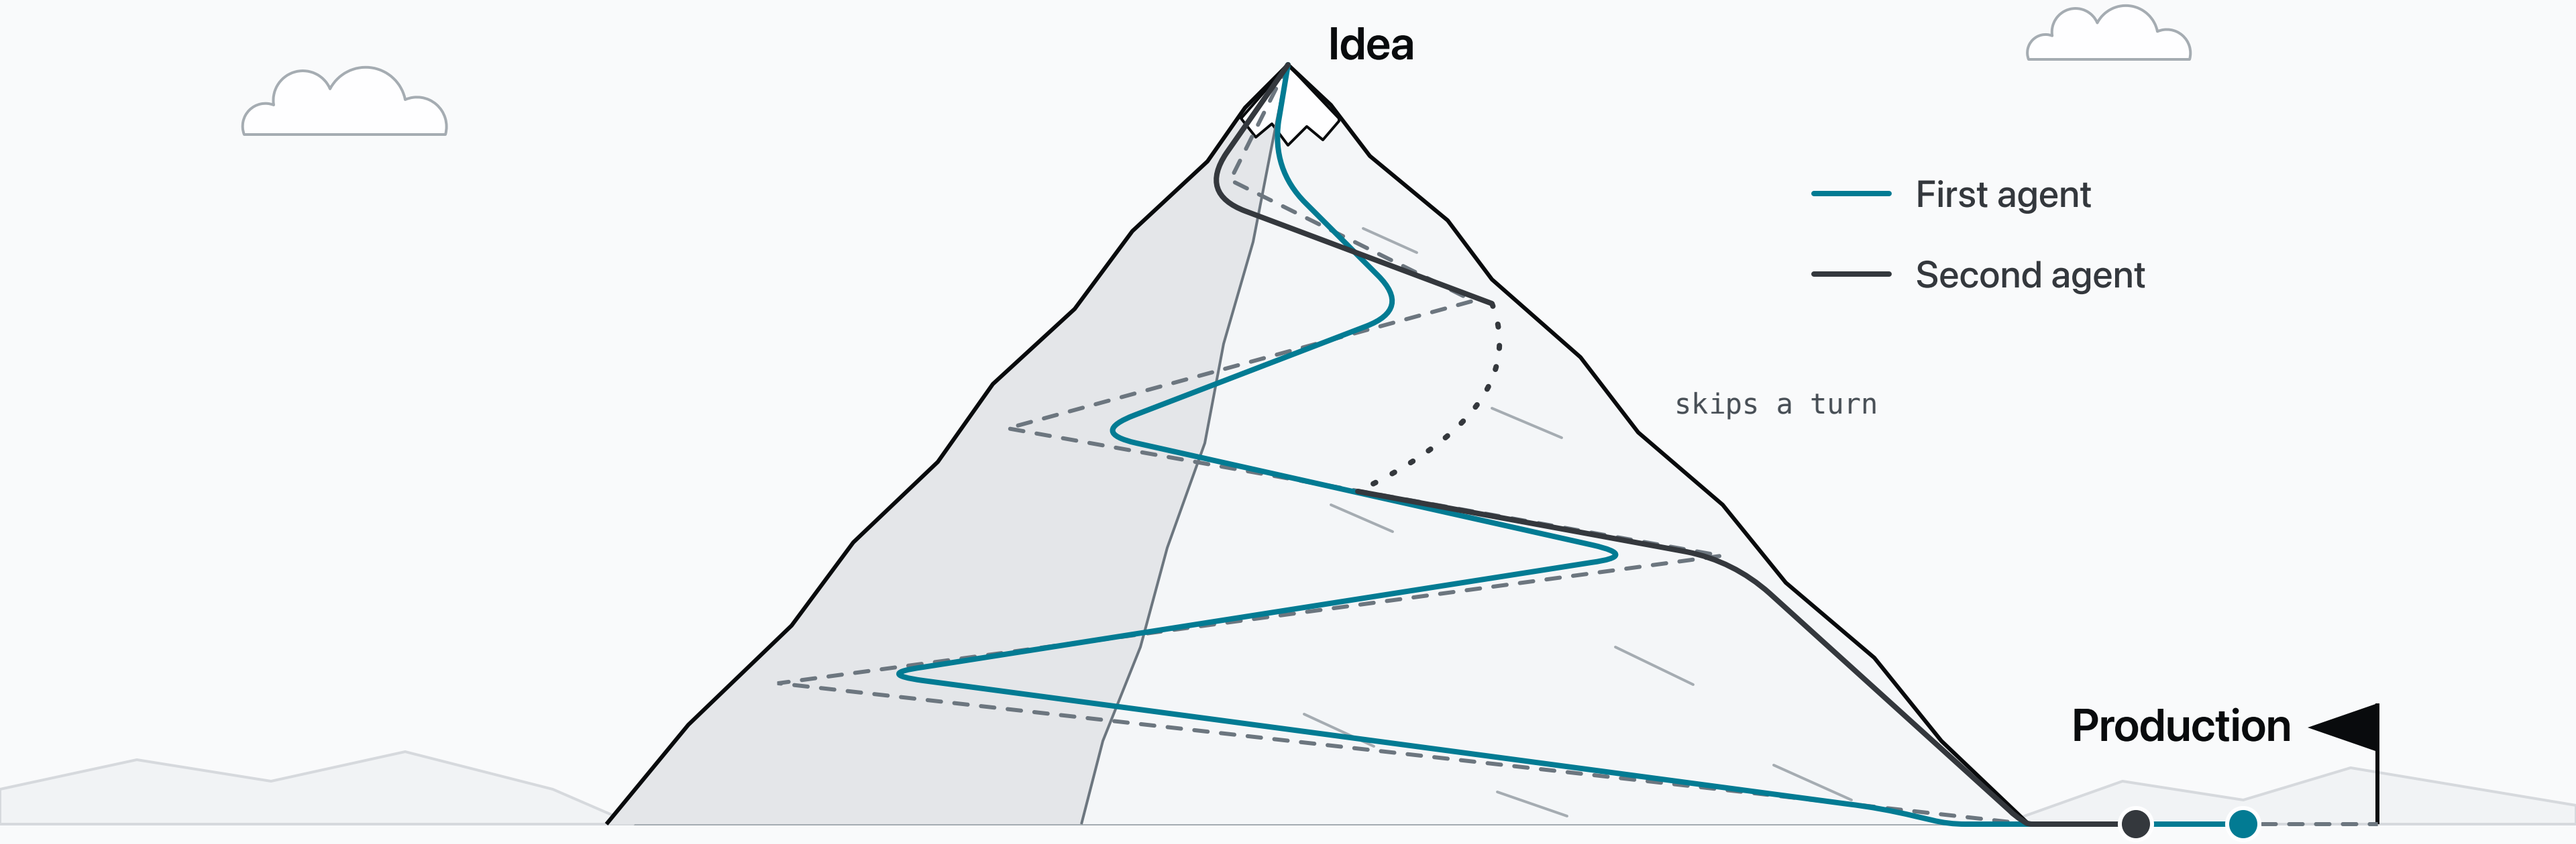

Why we are here.

How an agent gets from an idea to production,
told as one mountain walked three times.

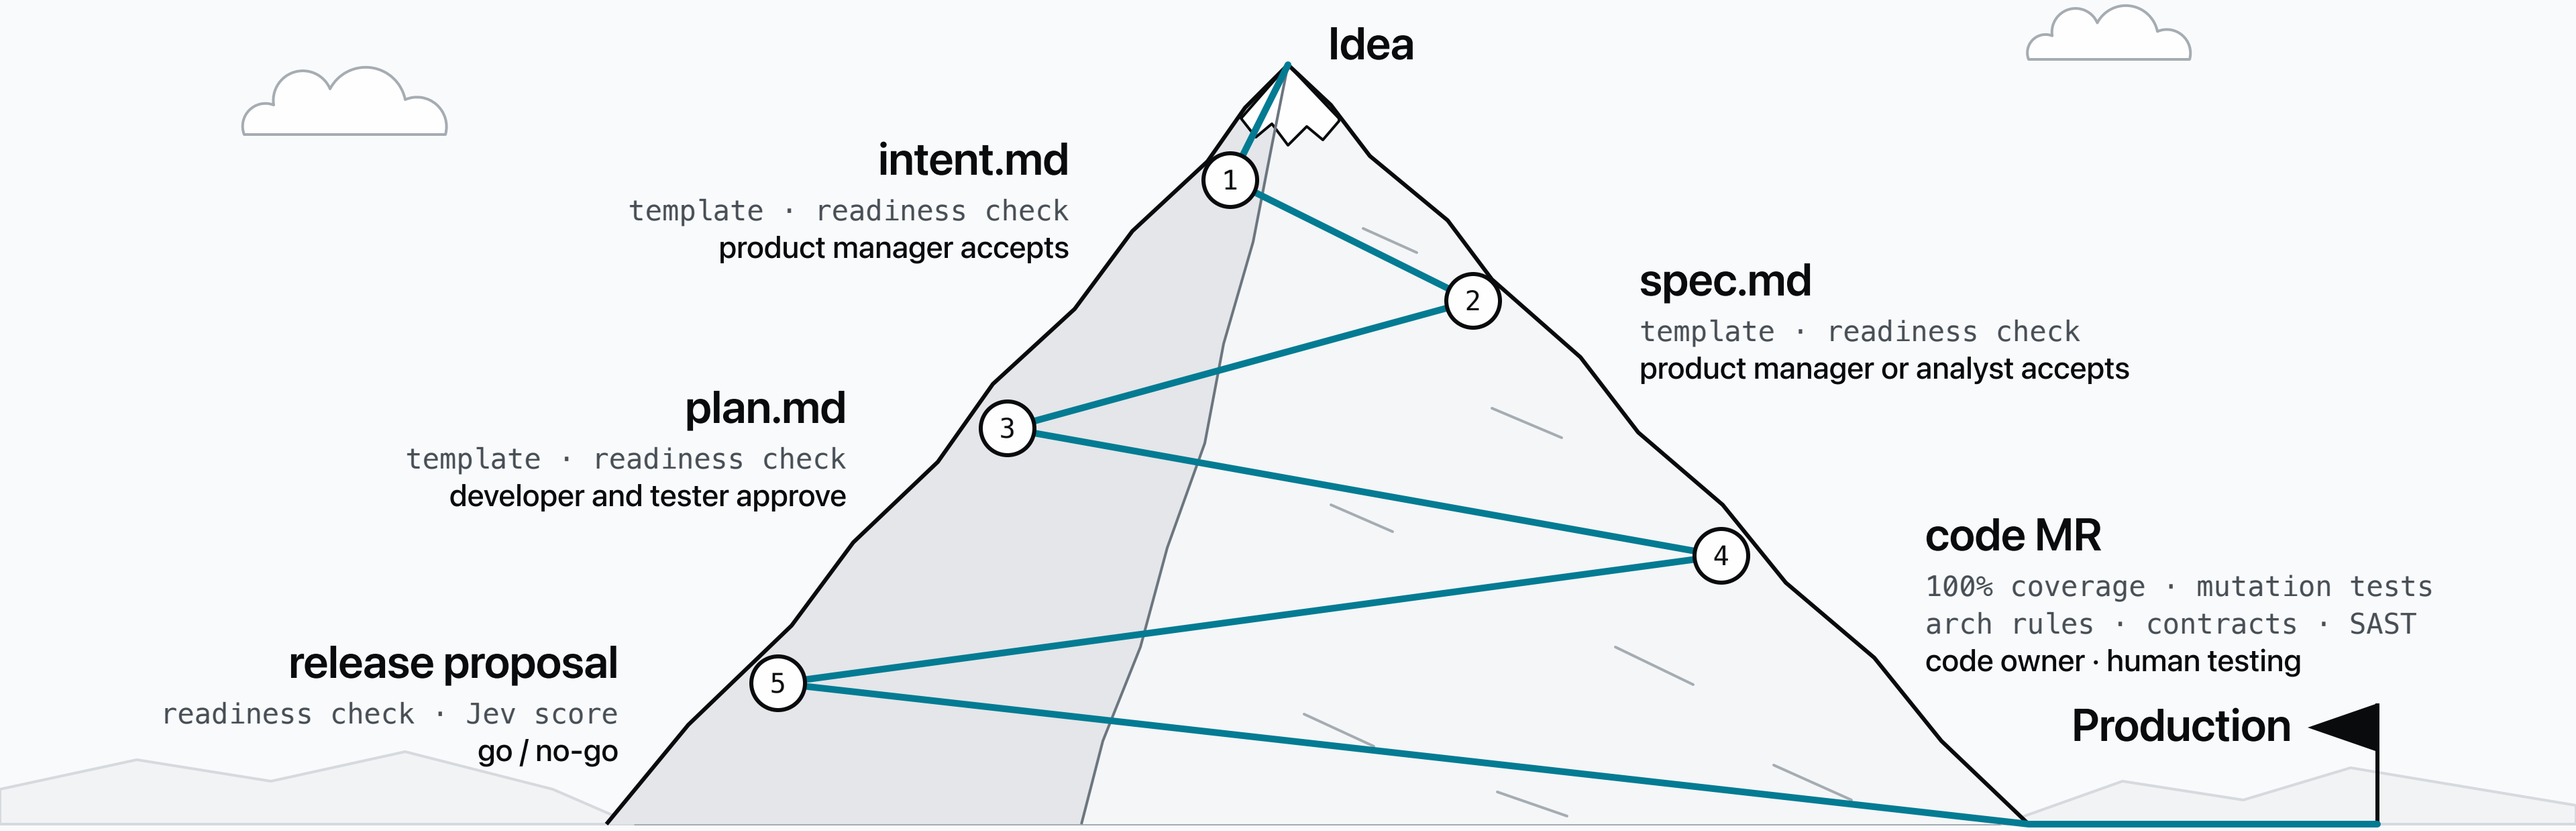

The leap of faith

A path, no checkpoints

A trail with checkpoints

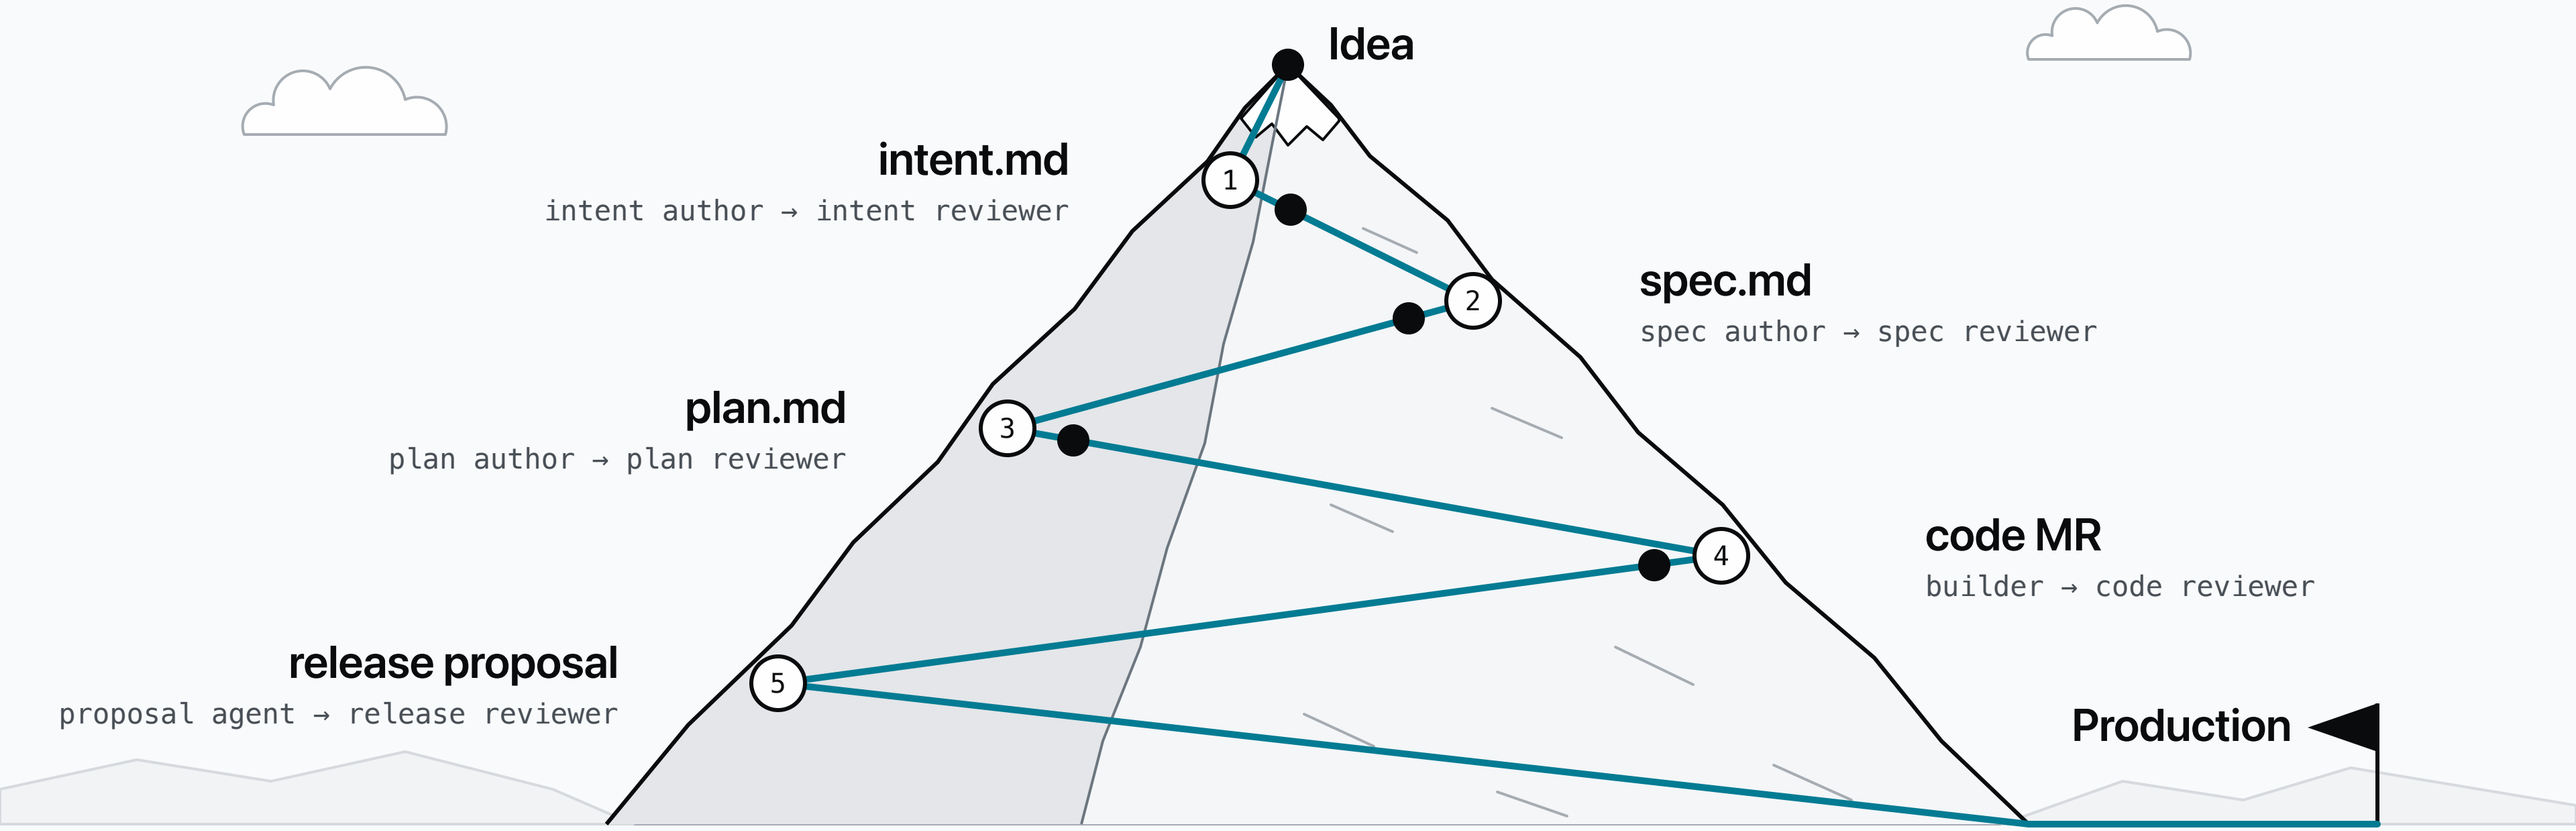

What a checkpoint checks

Template check	Every heading filled in, every ID unique, every Jira key real. A script on the merge request.
Readiness check	A second agent judges the artifact without the author's context, and passes it or sends it back with reasons.
CI gate cluster	Coverage, mutation testing, architecture rules, contracts and secret scanning, before a person looks.
Human approval	A person accepts what the agent produced. The agent that writes never approves.

One agent on the whole trail carries the whole trail.

By the time it reaches the tests, the intent sits far back in a context window that only fills up.

A relay of specialized agents

One agent, or one per leg

One agent	Specialized agents
Walks the whole trail	One per leg
Carries every phase in one context window	Starts fresh and reads one artifact
Loses the intent as the window fills	Works on a slice sized for one fresh context
Checks its own work	Is judged by a reviewer that never saw the authoring
One long session, one step at a time	Unblocked slices built in parallel, each in its own worktree
Pays for the whole history on every step	Cheaper: a small context, on the lightest model that fits

Update

This path is what we worked on since the last update.

Every phase now has its artifact, its agents and its gates worked out in detail, so the SDLC meetings can restart from a draft.

Coaching for Ponto dev

01

Concluded

The coaching for the Ponto development team has finished.

02

Well received

Reactions were very positive, and everyone seems to have taken something from it.

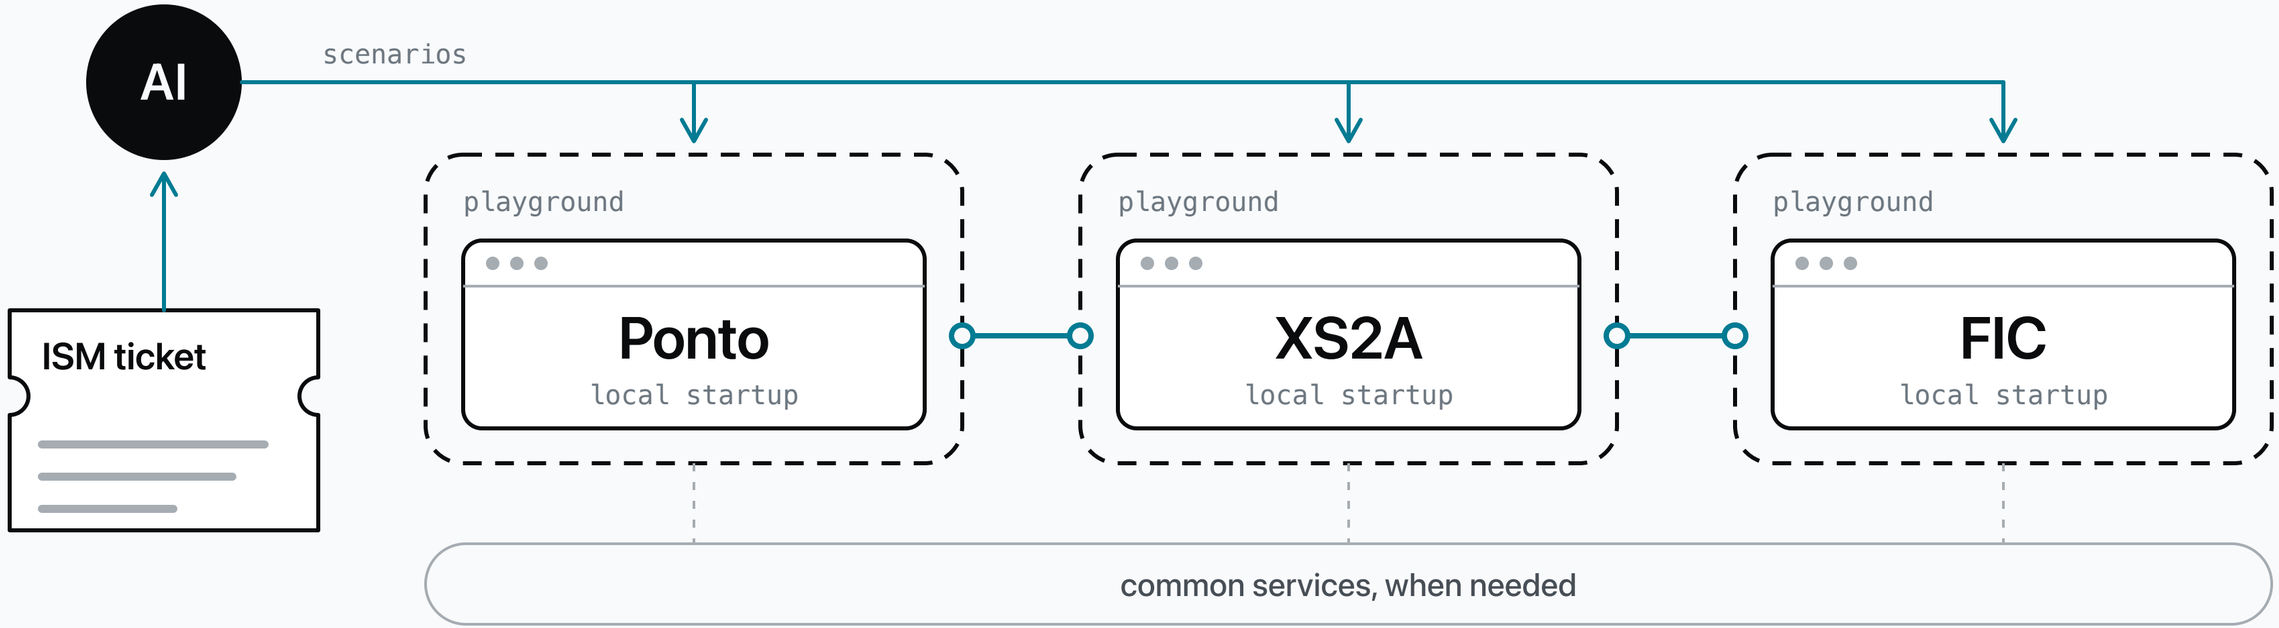

03

Asked for ops and marketplace

Ugo, the new team lead for Ponto, asked to extend the coaching to ops and marketplace.

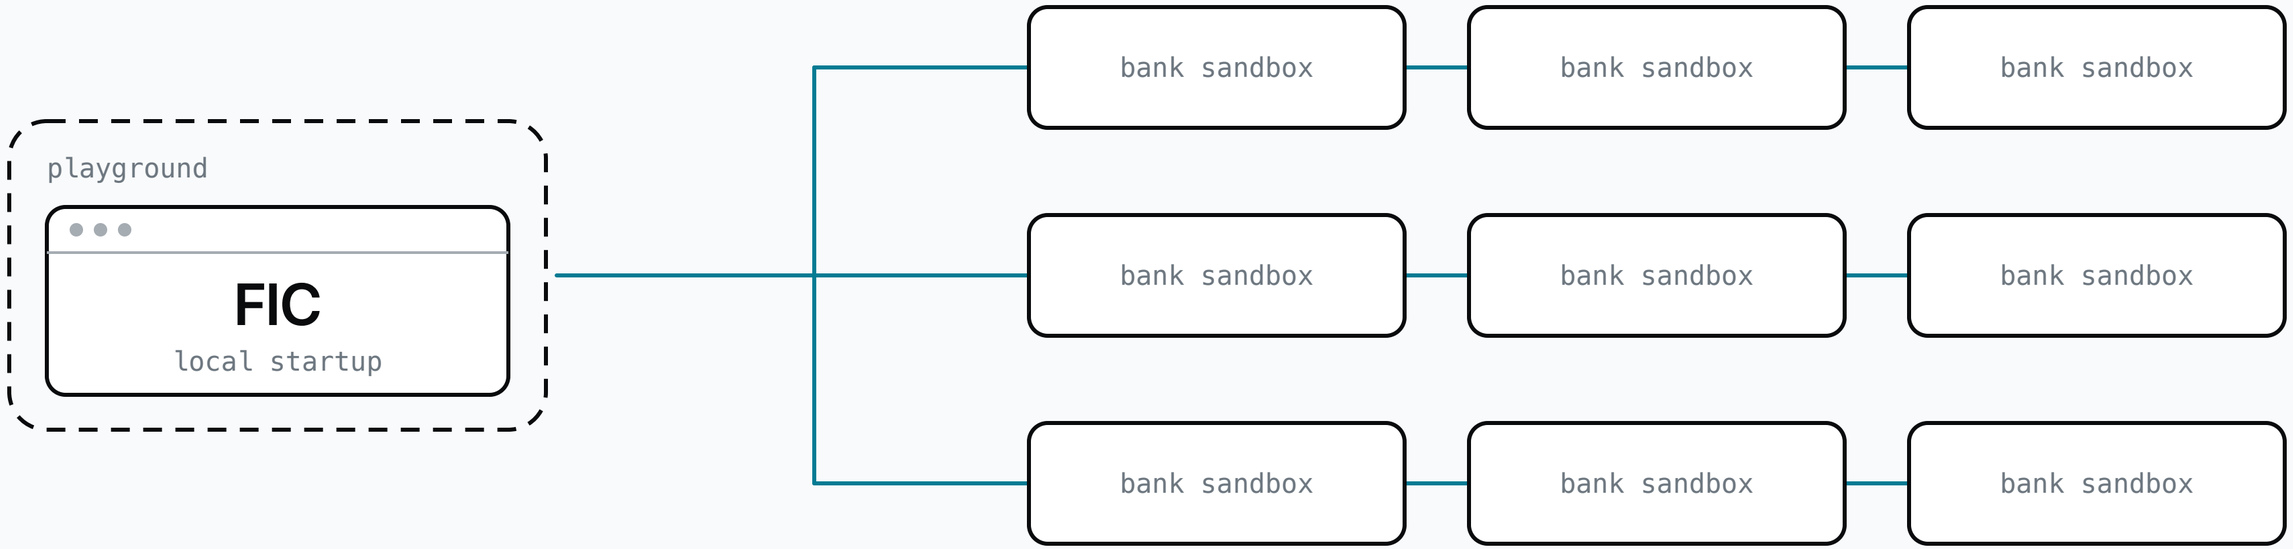

Playgrounds for ISM tickets

Each playground is a local startup of one application. It runs on its own or joined to the others, so the AI can replay what a ticket describes.

FIC on real bank sandboxes

The FIC playground connects to the sandboxes the real banks offer. Nine are implemented.

Next: two ISM tickets, migrating the ING PSD2 API to v2.

Where we are held back

Detail before direction	Many views and opinions. Talks go deep into details before the broad picture stands; we would fill those in as we meet them.
Different priorities	Ours are not always those of others. We are still waiting on the VM to run an autonomous agent.
Ponto: the riskier release	The Ruby upgrade is wanted before the test suite that makes it safe, chosen for local goals over the broad ones.
Two camps, one project	Ops and dev decide apart where one team should carry it. Everything escalates to management, with no aim beyond each camp's own priorities.
